Data_Analyst — Step 6

Create a Data Portfolio

Detailed Learning Notes • CareerCompass

1. Learning Objective

Package analytical work so recruiters and hiring managers can quickly see evidence of practical ability.

2. Core Concepts — Detailed Breakdown

Portfolio structure

Include a short introduction, skills, 2–4 projects, links to dashboards/code and contact information.

Project README

State the problem, dataset, tools, methodology, key findings, limitations and how to reproduce the analysis.

Visual proof

Screenshots or public dashboard links should show polished outputs. Do not publish confidential data.

Storytelling

Lead with the business question and result, then provide technical detail for readers who want it.

Maintenance

Keep repositories organized and remove broken links or obsolete files.

3. Recommended Learning Workflow

- Select your strongest projects.
- Rewrite READMEs for a non-technical first read.
- Add screenshots and concise findings.
- Verify every link.
- Ask someone unfamiliar with the project to explain what they think it does.

5. Hands-on Project / Practice

Create a portfolio with three projects: SQL business analysis, Python EDA/automation, and BI dashboard. Each project gets a one-paragraph summary, three key findings, tool list, methodology and limitations.

6. Common Mistakes & Pitfalls

- Portfolio is just a list of certificates.
- Huge notebooks with no explanation.
- Broken links.
- No screenshots or outcomes.
- Claiming dashboards/skills that are not your work.

7. Completion Checklist

- I have three polished projects.
- Each has a clear business question.
- Each project explains methods and findings.
- All links work.
- I can present each project in under two minutes.

8. Interview / Assessment Questions

- Which project best represents your skills?
- What business value did your dashboard create?
- How did you validate the analysis?
- What was the hardest data-quality issue?
- What would you improve next?
