

DevOps Engineer

Step 1: Learn Linux & Networking

CareerCompass — Detailed Learning Notes

What this step is about

Build the operating-system and networking foundation on which DevOps tools depend.

Core Concepts

- Learn the Linux filesystem, shell, processes, users/groups, permissions, packages, services, logs, environment variables and SSH.
- Practice pipes, redirection, grep, find, permissions, process management and service management.
- Understand IP addresses, DNS, TCP/UDP, ports, HTTP/HTTPS, routing, firewalls and basic troubleshooting.
- Use curl, ping, traceroute, ss/netstat, dig/nslookup and ssh for diagnosis.

Skills You Should Be Able To Demonstrate

- Create users and groups.
- Change ownership and permissions.
- Use SSH.
- Trace DNS and HTTP problems.
- Read service logs.

Hands-on Project / Practice

- Run a Linux VM and deploy a simple web server.
- Document the ports, permissions, process and logs involved.
