

DevOps Engineer

Step 2: Master Git & Scripting

CareerCompass — Detailed Learning Notes

What this step is about

Automate repeatable operational tasks and manage infrastructure code safely.

Core Concepts

- Learn commits, branches, merges, pull requests, remotes, tags and conflict resolution.
- Understand when rebase is useful and why shared history should be handled carefully.
- Learn Bash variables, conditions, loops, functions, exit codes, pipes and command substitution.
- Write scripts that validate input, fail clearly and can be run repeatedly without corrupting state.

Skills You Should Be Able To Demonstrate

- Create and merge branches.
- Resolve a merge conflict.
- Write a Bash backup script.
- Use exit codes and logs.
- Store scripts in Git with documentation.

Hands-on Project / Practice

- Build a deployment helper script that validates configuration, pulls code, builds an artifact and reports failures.
- Add a dry-run option.
