

DevOps Engineer

Step 5: Master Cloud Platforms

CareerCompass — Detailed Learning Notes

What this step is about

Learn one cloud deeply enough to deploy, secure and operate applications.

Core Concepts

- Understand compute, object/block storage, managed databases, networking, IAM, regions/availability zones and monitoring.
- Choose one cloud first. AWS, Azure and Google Cloud share concepts but differ in services and naming.
- Use least-privilege IAM, budget alerts and cleanup procedures.
- Deploy an application and document its architecture and security boundaries.

Skills You Should Be Able To Demonstrate

- Explain IaaS/PaaS/SaaS.
- Deploy a small application.
- Configure IAM safely.
- Create a budget alert.
- Read cloud logs and metrics.

Hands-on Project / Practice

- Deploy a containerized application to one cloud platform.
- Document compute, network, storage, IAM and estimated cost.
