

Mobile App Developer

Step 2: Choose Android or iOS

CareerCompass — Detailed Learning Notes

What this step is about

Choose one native platform so your learning path has a clear target.

Core Concepts

- Android commonly uses Kotlin and Android Studio; iOS uses Swift and Xcode.
- Compare target audience, hardware availability, language preference, development environment and publishing requirements.
- Android supports development on Windows/macOS/Linux; standard iOS development requires macOS and Apple tooling.
- After choosing a platform, learn its lifecycle, navigation, permissions, storage, networking and release process.

Skills You Should Be Able To Demonstrate

- Install the official SDK/IDE.
- Run a starter application on an emulator or device.
- Write down why you selected the platform.
- Understand the platform's application lifecycle at a basic level.

Hands-on Project / Practice

- Create a three-screen native starter app with navigation and one form.
- Document setup and run instructions in README.md.
