

# Mobile App Developer

## Step 3: Learn Flutter or React Native

CareerCompass — Detailed Learning Notes

### What this step is about

Learn one cross-platform framework deeply enough to build and ship a complete app.

### Core Concepts

- Flutter uses Dart and a widget-based UI system; React Native uses JavaScript/TypeScript and native platform capabilities.
- Learn project structure, components/widgets, state, navigation, forms, styling, networking and debugging.
- Do not learn Flutter and React Native deeply at the same time. Choose one for the main project.
- Use packages selectively and verify maintenance, compatibility and documentation.

### Skills You Should Be Able To Demonstrate

- Build reusable UI components.
- Navigate between multiple screens.
- Consume a REST API.
- Implement loading, error and empty states.
- Handle basic responsive layouts.

### Hands-on Project / Practice

- Build a weather, expense or habit-tracker app with at least three screens and one API integration.
- Keep networking and UI logic separated.
