

Mobile App Developer

Step 5: Build Real-world Apps

CareerCompass — Detailed Learning Notes

What this step is about

Move from tutorial exercises to portfolio-quality applications.

Core Concepts

- Real apps need validation, persistence, authentication, API integration, accessibility, responsive layouts and error states.
- Separate UI, state, data access and domain logic. Avoid one huge screen file.
- Use Git from the first commit and write a README that explains setup, features, screenshots and limitations.
- Test multiple screen sizes and at least one physical device when possible.

Skills You Should Be Able To Demonstrate

- Define requirements before coding.
- Create a simple architecture diagram.
- Add validation and error states.
- Test on emulator and physical device.
- Keep secrets out of source control.

Hands-on Project / Practice

- Build a campus marketplace, habit tracker, event app or expense tracker with authentication, persistent data and a polished UI.
- Include a clear README and screenshots.
