Concept & Learning Objective

Employers need evidence that you can build, debug and maintain an application. A portfolio should therefore show finished projects and the engineering decisions behind them.

Prepare for language fundamentals, OOP, data structures, asynchronous programming, lifecycle, state management, networking, persistence, security, testing and debugging. Project interviews often go deeper than syntax questions: be ready to explain a difficult bug, a performance issue and an architectural trade-off.

Core Concepts — Detailed Breakdown

- Portfolio: two or three polished apps with screenshots, source, README and live/store link.
- Project case study: problem, users, requirements, architecture, data flow, challenges, solution and limitations.
- Technical interview: language fundamentals, collections, OOP, async code, lifecycle, state, networking and storage.
- Debugging interview: reproduce, isolate, inspect logs/state, form hypothesis, fix, test and prevent regression.
- Behavioral preparation: explain ownership, teamwork, feedback and how you learned from failures.

What You Should Be Able To Do

- Finish two strong apps.
- Write a one-page resume focused on evidence.
- Practice a 60-second project explanation.
- Solve basic coding/data-structure problems.
- Prepare five deep questions and answers about each project.

Hands-on Project / Practice

- Create a portfolio with one native/cross-platform app and one API/Firebase app. For each, record a short demo and a written postmortem of one difficult technical problem.
