

Frontend Developer — Step 7: Apply for Jobs

Expanded notes: portfolio, resume, LinkedIn, GitHub, interviews, DSA, behavioral questions and job strategy

1. Portfolio Preparation

Definition

A portfolio is a curated presentation of your skills and evidence through projects, work and technical details.

Project card

Problem → features → technologies → your contribution → live demo → source code → technical explanation.

Quality

Prefer a few polished, working projects over many unfinished ones. Test every live link.

2. Resume Preparation

Purpose

A resume quickly communicates relevant skills and evidence for a role.

Sections

Contact → summary → skills → projects → experience/internships → education → relevant achievements/certifications.

Bullet formula

Action + technology + feature + genuine result.

Built a responsive career-exploration platform using JavaScript, Flask and MySQL, with roadmap-based resource dis

Keep claims truthful. Do not add skills or experience you cannot explain in an interview.

3. LinkedIn & GitHub

LinkedIn

Use a clear headline, concise About section, relevant skills and links to strong projects.

GitHub

Pin strong repositories, write useful READMEs, keep projects runnable and never expose secrets.

Consistency

Project names, technologies, dates and claims should be consistent across resume, LinkedIn and portfolio.

4. Job Search & Application Tracking

Channels

Company career pages, job boards, professional networks, referrals, internships and local opportunities.

Tracker

Company	Role	Date	Link	Status	Follow-up	Notes
---------	------	------	------	--------	-----------	-------

Tailoring

Identify genuine role requirements and highlight matching skills/projects truthfully.

5. HTML, CSS & JavaScript Interview Topics

HTML

Semantic HTML, forms, accessibility, document structure, links/media and attributes.

CSS

Box model, specificity, display, position, Flexbox, Grid, responsive design, units, transitions and layout debugging.

JavaScript

Variables/types, scope, closures, arrays/objects, functions, DOM, events, promises, async/await, fetch, ES6+, modules, errors and event-loop basics.

Answer pattern

Definition → simple example → practical use → common mistake.

6. React Interview Topics

Core

Components, JSX, props, state, events, lists/keys, hooks, effects and forms.

Application

Routing, API integration, loading/error states, shared state and Context.

Performance

Understand unnecessary work, profiling, lazy loading and basic memoization concepts.

7. DSA & Problem Solving

Definitions

Data structures organize data; algorithms are procedures for solving problems. Big-O describes how time/space grows with input size.

Common topics

Arrays, strings, hash maps, stacks, queues, sorting/searching, two pointers, sliding window, recursion and basic trees/graphs.

Problem → examples → constraints → approach → implementation → edge cases → complexity

Edge cases

Empty input, one item, duplicates, boundaries, large values and invalid input.

8. Behavioral & Project Questions

STAR definition

Situation → Task → Action → Result.

Prepare

Why did you build it? Architecture? Database design? Hardest bug? Trade-offs? Security? Deployment issue? What did you implement? What would you improve?

Best practice

Use specific real examples instead of vague statements.

9. Mock Interviews & Communication

Technical communication

Restate problem → assumptions → approach → implementation → tests → complexity/trade-offs.

Mock loop

Timed question → solution → explanation → feedback → repeat.

Interview performance includes reasoning, communication and debugging—not only the final code.

10. Job-Ready Checklist

Portfolio live ✓ 2–4 strong projects ✓ GitHub clean ✓ Resume tailored ✓ LinkedIn updated ✓ HTML/CSS/JS ✓ React ✓ API/database ✓ Git ✓ Basic DSA ✓ Mock interviews ✓ Application tracker ✓ Professional communication.
